

Modified beam and block
Screed laid on *Collecta* YELOfon HD10+ resilient layer *System*

Screed	65mm (min) sand cement screed, or 40mm proprietary screed, nominal 80kg/m ² mass per unit area
Resilient layer	YELOfon HD10+ with E-strip perimeter edging and J-strip acoustic joining tape (See Table CF12 for full details)
Structural floor	<ul style="list-style-type: none"> • 150mm (min) pre-stressed floor beams • 100mm rebated dense concrete infill blocks in-situ cast concrete to seal floor • 300kg/m² (min) mass per unit area (including shuttering only if it is solid concrete or metal and any bonded screed if required)
Ceiling	See Table CF12 for ceiling treatment options

Fig. CF12

1	3						

* Code for Sustainable Homes (CSH) credits quoted are typical. Mat 1 value taken from the BRE Green Guide. Pol 1 credit is only awarded if all the other insulation products used have a GWP of <5. Hea 2 credits are based on the floor being pre-completion tested and the separating wall performing to at least the same acoustic standard. Credits subject to relevant category weighted value. See page 5 for further information.

Acoustic values

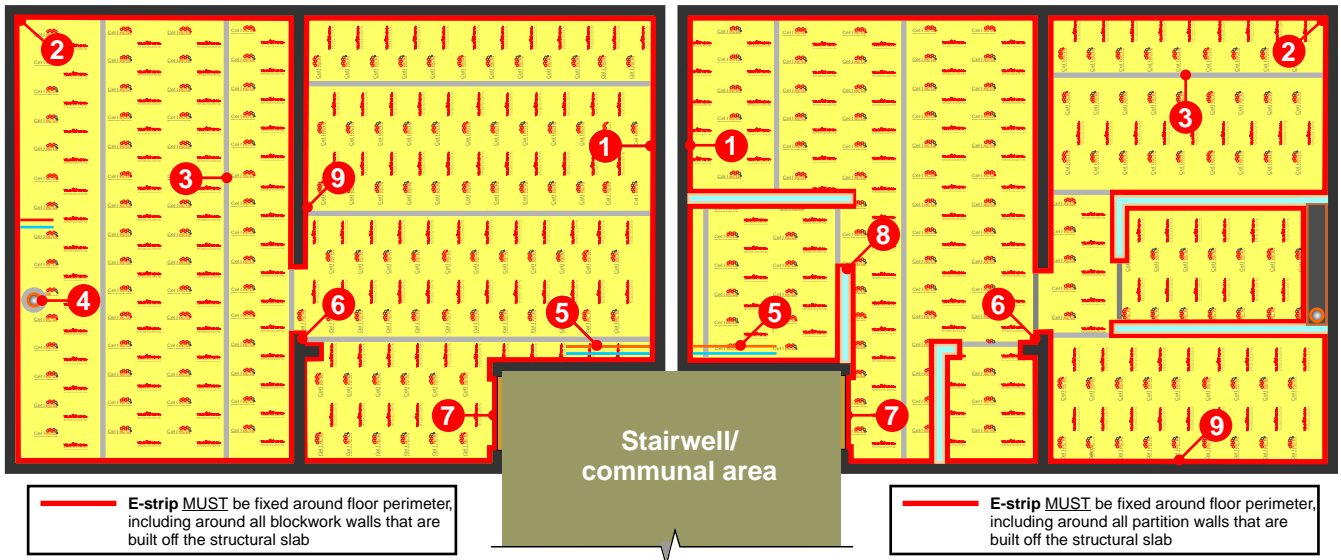

⁽²⁾ Values quoted are typical, based on the treatment being installed correctly and pre-completion tested.
Airborne performance tested in accordance with BS EN ISO 140-4:1998
Impact performance tested in accordance with BS EN ISO 140-7: 1998

Design & installation details - YELOfon HD10+

The acoustic performance of the floor will be compromised if the screed is not completely isolated from the structural slab, soil pipes, door frames, the surrounding walls and their treatments. To address this risk, each potential problem area needs to be detailed accordingly.

Partitions installed off the floor screed

Partitions installed before the floor finish is laid

1 Perimeter detail

Around the whole floor perimeter stick the E-strip to the wall, folding up the bottom flap and overlap with the HD10+ (by at least 40mm). Seal all joints with J-strip.

2 Room corners

In corners, mitre the E-strip's upper and lower flaps to allow them to fold in. The bottom flap must then be overlapped by the HD10+ by at least 40mm, with the joint sealed with J-strip.

3 Overlapping rolls

Overlap each roll of HD10+ by at least 150mm and seal all joints with J-strip. To totally eliminate the risk of screed migration, cover the HD10+ with a polythene sheet sealing all joints with a suitable tape.

4 Soil pipes

Soil pipes and services that penetrate through the HD10+ or E-strip **MUST** be isolated from the screed by wrapped them in E-strip and sealing the joints with J-strip.

5 Services

Services should be secured to the structural slab with straps and covered with HD10+. Alternatively, they can be laid over the HD10+ and held in position with J-strip until the screed is applied. Services that penetrate the resilient layer **MUST** be isolated from the surrounding structure by wrapping them in E-strip, and sealing all joints with J-strip.

6 Doorways

Ensure E-strip goes under **ALL** door frames to eliminate the risk of acoustic flanking.

7 Thresholds

To stop acoustic flanking at the threshold, fix a timber batten across the door opening to act as a "stop" and stick the E-strip to it. Trim off excess strip with a sharp knife.

8 Partitions

Should partitions be built off the sub-floor, stick the E-strip to the partition, folding up its bottom flap. Overlap the HD10+ and seal all joints and gaps with J-strip.

9 Wall treatments

Fold down the upper section of the E-strip and tape in position. Ensure **ALL** wall treatments including plaster, plasterboards, plaster adhesive and skirting boards are completely isolated from the screed.
